1 Calculate the microburst trains

First define a maximum time threshold between microbursts to qualify as a microburst train

[ ]:
```
threshold_s = 1
```

[ ]:
```
def intervals(dt, threshold_s=1):
    """
    Given a list of time differences, dt, calculate the start and end indices␣
↪for
    intervals where dt < threshold_s (units of seconds).
    """
```

```
    i = 0
    indices = np.zeros((0, 2), dtype=int)

    while i < len(dt):

        progressbar(i, len(dt))

        if (dt[i] > threshold_s) or np.isnan(dt[i]):
            i += 1
            continue
        else:
            j = i
            if j == len(dt):
                break
            while dt[j] <= threshold_s:
                j += 1
            # This assumes pandas's inclusive index slicing. Change j-1 to j␣
↪for numpy indexing.
            indices = np.vstack((indices, [i-1, j-1]))
            i = j
    print()  # Add a newline to avoid merging the progress bar and the next␣
↪print line.
    return indices

indices = intervals(cat['dt'], threshold_s=threshold_s)
indices
